

Evaluating the Faculty Development Program (FDP): A Post-Training Survey Analysis of Participant Feedback from 2025 to 2026

Lady Jean Geverola (2023-16004)

INTRODUCTION

The Faculty Development Program (FDP), offered through the Wadhwani Entrepreneurship Network Philippines, is a structured training program designed to equip higher education faculty with entrepreneurship and innovation pedagogy. Since its implementation in 2024, a total of 1,820 faculty records have been documented across 263 institutions nationwide, spanning both in-person and online delivery formats, though it is worth noting that the program is still ongoing and not all faculty have completed the training at the time of this writing. To monitor and continuously improve program quality, a post-training evaluation survey consisting of 23 Likert-scale items was administered exclusively to faculty who successfully completed the FDP and claimed their certification. This study analyzes 671 valid survey responses collected from 38 batches covering the 2024, 2025, and 2026 training cohorts, although the 2024 data yielded only six (6) responses from a single batch and is therefore acknowledged but excluded from the year-over-year comparative analysis. The findings of this analysis are intended to inform the next iteration of the FDP, particularly in light of recent platform and program updates introduced between the 2025 and 2026 training runs.

Statement of the Problem

This analysis seeks to evaluate the post-training feedback of faculty participants of the Wadhwani Entrepreneurship Network Philippines Faculty Development Program (FDP) based on survey responses collected from 2024 to 2026. Specifically, it aims to answer the following questions:

1. What is the overall level of participant satisfaction with the FDP in terms of:
 - a. Platform & Content
 - b. Instructor Quality
 - c. Student Engagement
 - d. Facilitator Support
 - e. Overall Satisfaction
2. What is the reliability of the post-training evaluation survey instrument as measured by Cronbach's Alpha?
3. Is there a statistically significant difference in participant satisfaction between the 2025 and 2026 training cohorts across the five dimensions?
4. What are the recurring themes and key concerns expressed by participants in the open-ended survey responses?
5. What improvements can be recommended for the FDP delivery and program structure based on the survey results?
6. What enhancements can be proposed to the post-training evaluation survey instrument to better capture participant experience in future training iterations?

METHODOLOGY

A. Research Design

This study employed a descriptive-quantitative research design, supplemented by qualitative content analysis of open-ended survey responses. The quantitative component assessed participant satisfaction levels and tested for statistically significant differences between training cohorts, while the qualitative component identified recurring themes and concerns from participant feedback.

B. Data Sources

Two datasets were used in this study:

1. **FDP Post-Training Evaluation Survey** — a Google Form survey consisting of 23 Likert-scale items (ranging from 1 = Strongly Disagree to 5 = Strongly Agree) and three (3) open-ended questions, administered to faculty who completed the FDP and claimed their certificate of completion.

2. **Consolidated Faculty Master List** — an institutional record maintained by the Wadhvani Entrepreneurship Network Philippines containing 1,820 faculty records from 263 institutions, including FDP start dates, completion dates, batch names, and certification levels. This file served as the reference for cross-validating training year assignments.

C. Respondents

The respondents of this study were faculty members who completed the FDP and voluntarily responded to the post-training evaluation survey. A total of 671 valid responses were collected from 38 training batches, distributed as follows:

Figure 1. Number of Respondents per Training Year

Note: It is important to note that only faculty who completed the program and requested their certification were prompted to answer the survey. As such, the respondents represent program completers only and do not include participants who are still ongoing or who did not pursue certification.

D. Survey Instrument

The 23 survey items were grouped into five thematic categories based on the core evaluation dimensions of the FDP. Platform & Content covered items related to the usability and organization of the Wadhvani platform, the quality of instructional materials, workload appropriateness, and the effectiveness of course assignments. Instructor Quality assessed the preparedness, subject mastery, and teaching effectiveness of the FDP instructors. Student Engagement captured self-reported behaviors of the participants, including attendance, preparedness, learning effort, intellectual challenge, and peer communication. Facilitator Support evaluated the approachability, availability, and overall helpfulness of the FDP facilitators. Finally, Overall Satisfaction measured the participants' general perception of the program, including whether they would recommend it, its educational impact, and whether it met their expectations. This grouping was established prior to analysis and served as the basis for both category-level descriptive statistics and the year-over-year comparative analysis.

The post-training evaluation survey consisted of 23 Likert-scale items grouped into five (5) thematic categories:

Table 1. Post-Training Evaluation Categories

Category	No. of Items / Questions
Platform and Content	6
Instructor Quality	5
Student Engagement	5

Facilitator Support	4
Overall Satisfaction	3

In addition to the Likert items, three (3) open-ended questions were included to capture qualitative feedback: (1) best aspects of the FDP, (2) areas for improvement, and (3) additional concerns and suggestions.

E. Data Processing and Analysis

All data processing and analysis were performed using Python 3 in Google Colaboratory, utilizing the following libraries: Pandas, NumPy, Matplotlib, Seaborn, SciPy, and WordCloud. The following analytical methods were applied:

- **Cronbach's Alpha** — to assess the internal consistency and reliability of the survey instrument
- **Descriptive Statistics** — mean, standard deviation, and median were computed for each item and category
- **Welch's Independent Samples t-Test** — to determine whether the differences in satisfaction scores between the 2025 and 2026 cohorts were statistically significant ($\alpha = 0.05$)
- **Pearson Correlation** — to identify potentially redundant survey items
- **Keyword Frequency Analysis and Word Clouds** — to surface recurring themes from open-ended responses

F. Data Cleaning and Year Classification

A significant data quality challenge was encountered during the analysis: 375 out of 674 survey responses (55.6%) had no recorded timestamp, making it impossible to automatically determine the training year from the survey data alone. To resolve this, the survey batch names were cross-referenced against the Consolidated Faculty Master List using FDP completion dates to accurately assign each response to its corresponding training year. Following this process, only three (3) rows remained unclassifiable due to both a missing timestamp and a blank batch name; these were excluded from the analysis. Additionally, the six (6) responses from the 2024 cohort, representing a single batch with an insufficient sample size, were acknowledged but excluded from the year-over-year comparative analysis.

RESULTS AND DISCUSSION

A. Reliability of the Survey Instrument

Before proceeding with the analysis, the internal consistency of the survey instrument was assessed using Cronbach's Alpha. As presented in Table 3, the overall alpha coefficient of the 23-item instrument was $\alpha = 0.9691$, which is considered excellent and confirms that the survey items consistently measure the same underlying construct. All five category subscales likewise demonstrated excellent reliability, with alpha values ranging from 0.9006 to 0.9409, indicating that the grouping of items per category is internally consistent and appropriate for analysis.

Table 2. Reliability of the Survey Instrument Using Cronbach's Alpha

Category	No. of Items	Cronbach's α	Interpretation
Overall (all items)	23	0.9691	Excellent
Platform and Content	6	0.9409	Excellent
Instructor Quality	5	0.9393	Excellent
Student Engagement	5	0.9006	Excellent
Facilitator Support	4	0.9384	Excellent
Overall Satisfaction	3	0.9388	Excellent

Note: Alpha values ≥ 0.90 are considered excellent (George & Mallery, 2003).

B. Category-Level Performance

Figure 2. Average satisfaction scores per thematic category, ranked from highest to lowest.

Overall Satisfaction emerged as the highest-rated category ($M = 4.784$), reflecting that participants strongly felt the FDP delivered educational value and met their expectations. Facilitator Support ranked second ($M = 4.771$), highlighting the facilitators' approachability and helpfulness as a major strength of the program. Student Engagement received the lowest average score ($M = 4.539$), which is notable as this category consists of self-reported items — meaning participants rated their own attendance, preparedness, and effort lower relative to other dimensions. This is a common pattern in self-assessment surveys and does not necessarily indicate a program deficiency, but rather an opportunity to design stronger engagement mechanisms in future runs.

C. Item-Level Analysis: Strengths and Areas for Improvement

Figure 3. Mean, standard deviation, and median for all 23 survey items.

The overall mean satisfaction rating across all 23 items was 4.69 out of 5.00, indicating a consistently high level of satisfaction among FDP completers. All individual items obtained mean scores above 4.40, suggesting that no aspect of the program was rated unfavorably by participants. The median score for all 23 items was 5.00, further reflecting a strong tendency toward the highest rating, which is consistent with the self-selected nature of the respondents — faculty who completed the program and pursued certification.

Top 5 Strengths: The five highest-rated items were Overall Facilitators Helpfulness ($M = 4.805$), High Educational Impact ($M = 4.799$), Program Recommendation ($M = 4.797$), Facilitators Accessibility ($M = 4.787$), and Instructor Subject Mastery ($M = 4.770$). These results consistently point to the facilitator team and the program's educational value as the strongest assets of the FDP.

Top 5 Areas for Improvement: The five lowest-rated items were Student Preparedness ($M = 4.414$), Peer Communication ($M = 4.523$), Student Attendance ($M = 4.545$), Student Learning Effort ($M = 4.545$), and Platform Easy to Navigate ($M = 4.613$). Notably, four of the five lowest-rated items belong to the Student Engagement category, which consists of self-reported behaviors. While these scores are still above 4.40 and cannot be considered negative, they suggest that participants acknowledge room for improvement in their own engagement. Platform navigation, the only non-engagement item in this group, is a recurring concern that also appeared frequently in the open-ended responses.

D. Year-over-Year Comparison: 2025 vs. 2026

To assess whether the platform and program updates introduced between training runs resulted in measurable changes in participant satisfaction, a Welch's independent samples t-test was conducted comparing the 2025 (n = 449) and 2026 (n = 216) cohorts across all five categories. The 2024 cohort (n = 6) was excluded from this comparison due to its insufficient sample size.

Figure 4. 2025 vs 2026: Item - Level Mean Scores

Figure 4 presents the item-level mean scores for all 23 survey items, comparing the 2025 and 2026 training cohorts side by side. Of the 23 items, 21 showed a slight decline, one item improved, and one remained stable from 2025 to 2026. The only item that improved was Student Preparedness (2025: M = 4.399; 2026: M = 4.440; $\Delta = +0.041$), suggesting that participants in 2026 reported slightly better self-preparation before sessions. The item with the largest decline was Platform Easy to Navigate (2025: M = 4.653; 2026: M = 4.528; $\Delta = -0.125$), followed by Overall Facilitators Helpfulness ($\Delta = -0.085$) and Facilitators Accessibility ($\Delta = -0.081$). The item with the smallest change was Student Learning Effort, which remained essentially stable ($\Delta = -0.009$).

It is important to note, however, that these item-level differences must be interpreted with caution due to a data imbalance between cohorts. The 2025 cohort comprised 449 respondents while the 2026 cohort had 216 — a ratio of approximately 2:1. Furthermore, the 2026 data represents a training year that is still ongoing at the time of this writing, with batches such as FDP June2026 (7–9PM) and FDP June2026 (2–4PM) having only recently concluded. This means the 2026 sample may not yet fully represent the complete range of participant experiences for that year. As confirmed by the Welch's t-test results in Table 3, none of the observed differences reached statistical significance (all p-values > 0.05), reinforcing that the slight declines reflected in Figure 4 are within the range of normal variation rather than evidence of a genuine decline in program quality.

Table 3. Year-over-Year Category Comparison with Welch's t-Test

Category	Mean 2025	Mean 2026	Change	t-statistic	p-value	significant?
Platform and	4.693	4.635	−0.058	1.231	0.2190	No

Content						
Instructor Quality	4.763	4.714	−0.049	1.150	0.2510	No
Student Engagement	4.542	4.524	−0.018	0.352	0.7250	No
Facilitator Support	4.792	4.722	−0.070	1.540	0.1246	No
Overall Satisfaction	4.798	4.748	−0.050	1.133	0.2578	No

Figure 5. Visualization of the Year-over-Year Category Comparison with Welch's t-Test

While all five categories show a slight decline in mean scores from 2025 to 2026, none of the differences were statistically significant (all p-values > 0.05). This means the observed decreases cannot be attributed to a genuine deterioration in program quality and are more likely due to natural variation across cohorts, differences in batch sizes, or the expansion of online delivery formats in 2026. The largest observed decline was in Facilitator Support ($\Delta = -0.070$), which may reflect the challenges of replicating the same level of facilitation quality in online batches introduced in 2026, such as FDP Jan2026 (online). Hence, these findings suggest that the program has maintained a consistently high level of participant satisfaction across both training years despite the transition to new delivery formats and platform updates.

F. Qualitative Analysis: Open-Ended Responses

To complement the quantitative findings, the three open-ended survey questions were analyzed for recurring themes using keyword frequency analysis and word cloud visualization.

Figure 6. Sample Responses for the Best Aspects (2025)

=====

TRAINING YEAR 2025 (n = 449 respondents)

=====

[BEST ASPECTS] (426 valid responses)

1. The best aspects of the FDP were its innovative pedagogy, hands-on learning, collaborative environment, expert mentorship, and technology integration, all of which enhanced teaching effectiveness and student engagement.
2. The venture journey wherein we were to come up with innovative ideas that has a possibility to be a startup company
3. Knowing the customer persona
4. The Platform
5. The diligent and knowledgeable facilitators, for me. They made the whole training a step further.

Figure 7. Sample Responses for Areas to Improve (2025)

[AREAS TO IMPROVE] (407 valid responses)

1. Please consider contextualizing the samples and lesson discussions on the platform to better align with the Philippine setting, as some examples currently reflect the Indian context.
2. Wadhwani Platform Navigation
3. Wadhwani Platform Navigation, Class Experience
4. Wadhwani Platform Navigation
5. Class Experience

Figure 8. Sample Responses for Suggestions (2025)

[SUGGESTIONS] (121 valid responses)

1. Kudos to Wadhwani! Special thanks to Ma'am Rose, Sir Chris, Doc Pam, and Pak Adi for their invaluable support!
2. Improve the platform navigation. There are times when we answer the quizzes, despite having strong internet connection it didn't turn out well and our quizzes did not move forward. Sometimes it lags too.
3. I hope the schedule will not disrupt our schedule as a faculty. I mean I can't attend the online session because I have classes scheduled on that time. Like it can be done during summer break, something like that. Thank you
4. flexible methods of learning
5. -The platform cannot accommodate photos with high resolution; therefore, we need to reduce the quality to ensure they fit within the auto-generated presentation. -Some pictures uploaded for certain activities were not included in the presentation. -There is one row in the Mystyle platform that cannot be edited. -I hope instructors can have control over the release dates of quizzes. -While faculty deck presentations are helpful, some examples are tailored to the Indian context. It would be beneficial if they could also localize examples to include start-ups or companies relevant to the Philippine setting.

Figure 9. Sample Responses for Best Aspects and Areas to Improve (2026)

and "learning" reflects that participants most valued the venture creation journey and the practical, hands-on learning experience of the FDP. The frequent appearance of "platform," "easy," and "interactive" further suggests that when participants highlighted positive aspects, they appreciated the accessibility of the Wadhvani platform and the engaging format of the sessions. Words such as "facilitator," "knowledge," "practical," "interactive," and "development" also appeared with notable frequency, reinforcing the quantitative finding that the facilitator team and the program's educational value are the FDP's strongest assets.

Figure 12. Word Cloud — Areas for Improvement and Suggestions

Figure 12 was generated from the combined responses to the improvement and suggestions questions, totalling 808 valid responses. Among the improvement responses specifically (n = 612), the most frequently mentioned terms were "platform" (254 times), "navigation" (248 times), "experience" (247 times), and "class" (246 times). The near-equal frequency of these terms strongly suggests that platform navigation and the overall class experience are the two most pressing concerns among participants. The words "instructions" and "announcements" each appeared 135 times in improvement responses, pointing to a specific gap in communication clarity — particularly relevant to the 2026 online batches. "Facilitators" and "clear" each appeared 136 times, indicating that while participants value the facilitators highly in the quantitative ratings, they also expect continued improvement in facilitator communication and technical guidance. In the suggestions responses (n = 196), the word "schedule" appeared 12 times, consistent with the recurring request for training to be held during summer breaks or outside of regular teaching hours.

CONCLUSION

This study analyzed 671 valid post-training survey responses from faculty participants of the Wadhvani Entrepreneurship Network Philippines Faculty Development Program (FDP), covering 38 batches across the 2024, 2025, and 2026 training cohorts. The primary objective was to assess participant satisfaction, identify strengths and areas for improvement, and determine whether the program updates introduced between training years resulted in measurable changes in feedback.

The analysis yielded a highly reliable survey instrument with an overall Cronbach's alpha of $\alpha = 0.9691$, confirming the internal consistency of the 23-item tool across all five evaluation dimensions. The overall mean satisfaction score of 4.69 out of 5.00 reflects a consistently high level of satisfaction among program completers. The Facilitator Support and Overall Satisfaction categories consistently ranked highest, underscoring that the FDP's facilitator team and its educational impact are its most valued strengths. The Student Engagement category received the lowest scores, though this is attributed to the self-reported nature of its items rather than a program deficiency.

The year-over-year comparison between the 2025 and 2026 cohorts revealed that while 21 out of 23 items showed slight numerical declines, none of the differences were statistically significant (all p-values > 0.05). These findings must be interpreted within the context of two important data limitations: first, the 2025 cohort (n = 449) was more than twice the size of the 2026 cohort (n = 216), creating an imbalance that affects the reliability of direct comparisons; and second, the 2026 data represents an ongoing training year, meaning the current results reflect only a portion of the

2026 cohort's experiences. Despite these limitations, the available evidence is sufficient to conclude that the FDP has maintained a consistently high level of participant satisfaction across training years, and that the platform and program updates have not negatively impacted the overall participant experience in a statistically meaningful way.

The qualitative analysis further enriched these findings. Platform navigation (mentioned 248 times), the localization of content to the Philippine context, and scheduling flexibility emerged as the three most consistent concerns across both years. Conversely, the hands-on venture creation experience, the quality of facilitators, and the program's practical relevance to teaching were consistently cited as its greatest strengths. The 2026 cohort additionally surfaced a new concern about the clarity of facilitator instructions and announcements, which appears to be linked to the introduction of online delivery formats.

Given that the primary purpose of this evaluation is to understand participant experiences and generate actionable feedback for the next training run, the findings of this study — despite the data imbalance and the ongoing nature of the 2026 training year — are sufficiently reliable and informative to guide program improvement decisions.

RECOMMENDATION

Based on the findings of this analysis, the following recommendations are addressed to the Wadhvani Entrepreneurship Network Philippines and the FDP programme management team:

1. Address Platform Navigation as a Priority

Platform Easy to Navigate was among the lowest-rated item ($M = 4.613$) and the item with the largest year-over-year decline ($\Delta = -0.125$). It was also the most frequently cited concern in open-ended responses, with the word "navigation" appearing 248 times. It is recommended that the program team develop a structured onboarding module or tutorial video that walks first-time participants through the Wadhvani platform before the training officially begins. Platform technical issues such as quiz submission failures and lag — mentioned multiple times in the 2025 suggestions — should also be escalated to the platform development team for resolution.

2. Localise Platform Content to the Philippine Context

A recurring concern in both 2025 and 2026 responses was the observation that examples, case studies, and company references in the platform reflect an Indian rather than a Philippine setting. It is recommended that the Wadhvani Foundation work with local program partners to develop or adapt at least a portion of the course content — particularly the venture examples and business case studies — to feature Philippine-based startups and entrepreneurs. This would significantly improve the perceived relevance of the program for Filipino faculty.

3. Design Structured Pre-Session Engagement Activities

Student Preparedness ($M = 4.414$) and Student Attendance ($M = 4.545$) were the two lowest-rated items in the entire survey. To address this, it is recommended that program coordinators send pre-session reading materials, preparation guides, or short tasks at least three days before each session. This primes participant engagement and signals the expectation of active participation.

4. Introduce Structured Peer-Learning Activities

Peer Communication was among the lowest-rated items ($M = 4.523$), and its decline from 2025 to 2026 suggests this gap is not self-correcting. It is recommended that each FDP module include at least one structured peer-learning activity — such as peer feedback on venture drafts, collaborative case analysis, or group design thinking exercises — to deliberately build intellectual exchange among participants.

5. Develop an Online Delivery Orientation Kit

The 2026 cohort introduced online batches such as FDP Jan2026 (online), and the qualitative findings show that online participants specifically raised concerns about clear instructions and announcements from facilitators. It is recommended that the program team develop a standardized orientation kit for online participants that covers platform navigation, communication channels, submission procedures, and facilitator contact information before the first session.

6. Review Facilitator Workload for Growing Cohorts

Facilitator Support showed the largest category-level decline from 2025 to 2026 ($\Delta = -0.070$). While this is not statistically significant, the trend is consistent across all four facilitator-related items. As the program continues to scale across more institutions and delivery formats, it is recommended that the program team assess facilitator capacity and consider adding support facilitators or mentor-pairs for larger or online cohorts to maintain the high standards of facilitator responsiveness that participants have come to expect.

7. Revisit Training Scheduling

Multiple participants in both years mentioned that training sessions conflicted with their regular teaching loads and institutional responsibilities. Several suggested scheduling training during summer breaks or outside of the regular academic semester. The program team is encouraged to consult with institutional partners on preferred scheduling windows when planning future batch calendars.

8. Collect Timestamps Consistently in the Survey

A critical data quality issue encountered in this analysis was that 378 out of 674 (56.1%) had no recorded timestamp, making year classification dependent on manual cross-referencing. It is strongly recommended that the Google Form be configured to always capture response timestamps, and that the batch name dropdown options consistently include the training year (e.g., "FDP June 2025 — Batch 1" rather than just "June Batch"). This would significantly improve the quality and traceability of future survey data.

9. Proposed Additions to the Survey Instrument

While the current 23-item instrument demonstrated excellent reliability ($\alpha = 0.9691$), the following five questions are proposed for inclusion in future versions of the post-training evaluation survey to better capture dimensions of the FDP experience that are currently not measured:

Proposed Question	Category	Rationale
The examples and case studies in the platform were relevant to the Philippine educational context.	Platform & Content	Addresses the recurring concern about Indian-context content raised in both years.
The online delivery format (synchronous/asynchronous) was effective for this type of training.	Platform & Content	Measures delivery mode effectiveness as online batches continue to grow.
I feel more confident integrating entrepreneurship and innovation concepts into my teaching after this programme.	Overall Satisfaction	Directly measures the FDP's stated mission of building faculty teaching confidence.
Feedback from the facilitators helped me improve my outputs during the programme.	Facilitator Support	Distinguishes feedback quality from general helpfulness, which are currently measured as one.

Appendix A. Data and Code Availability

The datasets, analysis code, and generated outputs used in this study are made available for transparency and reproducibility. Readers may access the following resources:

- **Survey Data & Output Files (Google Drive):**  FDP Survey

Note: The Google Drive folder contains the raw survey responses, the consolidated faculty master list, all generated charts and figures, and the full Excel report.
